                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        claim 2; Page 9; 26pp; Japanese.
The sequence is the open reading frame encoded by exon 9 of rice pyruvate orthophosphate dixinase (PPDK) gene, and which encodes precursor peptide. The gene shows tissue-specific (in rice leaf and rice arista) and seasonal specific expression. The PPDK gene may give a C4 photosynthesis function to a C3 plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W27822;

The DNA sequence was isolated from a library of clones of S. aureus WGCH 29 in Escherichia coll. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bacterial growth inhibiting peptide(s) enterocin 900 or brochocin C used to inhibit growth of susceptible bacteria in e.g. foodstuff, living animal, food preparation area or fermentation vessel Example 3; Page 140; 174pp; English.

This polypeptide comprises colicin V, a bacteriocin produced by Escherichla coll. Collicin V secretion in Lactococcus lactis hosts was obtained by fusion to the leucocin A leader peptide (see W59013). The invention provides secretion vectors in which the structural and immunity genes of bacteriocins, such as carnobacteriocin B2 (see W59029-31), collcin V, leucocin A and brochocin-C (see W59021), are fused to a signal peptide sequence, such as the collcin V signal peptide, allowing production and secretion of the bacteriocin(s) by host and heterologous bacteria. Bacteriocin cassettes encoding two or more bacteriocins are used to range of spoilage or pathogenic bacteria, e.g. B. coll and Salmonella. Using the technology of multiple bacteriocin production and delivery using lactic acid bacteria, a range of the gastrointestinal tract of humans and animals, and in the female
bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by s. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                        Gaps

Human macrophage c TSG-14. Tumour nec Human interleukin- Human interleukin- Modified xylanase Xylanase I of Tric Human cystatin-lik Fetal calf TP-like Polypeptide encode Polypeptide secode	ALIGNMENTS		10 cytoplasmic protein. eatment; infection; envelope; cteria; life cycle; activator; hronic gastritis; diagnosis;				uences and encoded to treat or prevent H. pylori lori infection English.	to prevent or treat H. pylori olypeptide binding compounds, ycle activators or inhibitors. ay be used for the	quences complementary to the can be used to prevent the odies against the protein can the abundance and distribution	CC (ATCC 55679) was determined from overlapping contigs generated CC analysed for ORF of at least 180 nucleotides, and the predicted CC analysed for ORF of at least 180 nucleotides, and the predicted CC coding regions defined by computer evaluation. To identify likely CC H. Pylori antigens for vaccine development, the amino acid Sequences predicted from various ORF were analysed for significant CC homology to other known or exported membrane proteins. Having CC identified and determined the sequences of interest, particular CC regions can be laclated from H. Pylori by PCR amplification for	e.g. in E. coil nosts.

Polypeptide(s) - useful in vaccines and encoused polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection

Profection and for diagnosis of H. pylori infection

This sequence is a H. pylori protein of unspecified function.

This sequence is a H. pylori protein of unspecified function.

This sequence is a H. pylori protein of unspecified function.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori life cycle activators or inhibitors. The useful as potential H. pylori life cycle activators or inhibitors. The pylori in a sample and the diagnosis of H. pylori infection of acid sequences complementary to the DNA act as antisense sequences and card sequences complementary to the DNA act as antisense sequences of adainst the protein can be used in immunoassays to evaluate the abundance of adainst the protein can be used in immunoassays to evaluate the abundance of the pylori (ATCC 55679) was determined from overlapping contigs generated for modistribution of H. pylori-specific antigens. The sequences were analysed for membrane proteins and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF wenter analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by pcr in hosts.

Helicobacter infection. 85 Helicobacter polypeptides (see W71474-W71558) are claimed, as well as isolated polynucleotides (see W72009-93) that encode them. The invention also provides: methods for producing these Helicobacter polypeptides in recombinant host systems, and related expression cassettes, vectors in transformed or transfected host cells; live vaccine vectors that contain the polynucleotides of the invention and which can be used to prevent or treat Helicobacter infection; therapeutic and/or prophylactic methods involving administration of polynucleotide incledies; polypeptides or monospecific antibodies; methods for detecting the presence of Helicobacter in samples using e.g. the polypeptides or monospecific antibodies; and methods for chromatography.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        promoter, signal sequence, mature enzyme and a terminator. The transformed cells are used to produce enzymes, especially lipase for undetergents. Other enzymes are useful in food, pharmaceutical and chemical industries. The system provides effective secretion of large quantities of enzyme into the culture medium. GPW seems to assist expression of enzyme and to protect it (and cells) against oxygen radicals, also to repair cell membranes damaged by oxygen radicals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Expression system containing regulatory sequences from P. wisconsinensis - and optionally modulator and GPW protein sequences, especially for lipase production for use e.g. in detergents Claim 23; Pages 36-38; 74pp; French. This sequence, isolated from Pseudomonas wisconsinensis, is a lipase modulator. A claimed expression system for production of an enzyme, especially a Pseudomonas lipase, comprises at least sequences for a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lipase modulator from P. wisconsiensis.
Pseudomonas wisconsinensis; lipase modulator; expression system; enzyme production; detergent.
Pseudomonas wisconsinesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a MCG18 protein. The protein has gene regulatory functions, and has homology to a zinc finger protein. The specification also describes MCG4, which is homologous to quantum nucleotide exchange factor protein, and MCG7, which is homologous to a heat shock protein or heat shock-binding protein. Detection of mutations in the MCG genes can be used to identify the propensity for various types of cancer, and to treat, arrest, or otherwise ameliorate, the effects of a cancer in an animal or bird.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New gene-expression regulatory genes, mcg4, mcg7, and mcg18 - encode a zinc finger protein, a GEF, and a heat shock or heat shock binding protein, useful to detect and treat cancer Claim 7; Fig 19; 80pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Helicobacter polynucleotide and polypeptide sequences - useful to treat or prevent gastrointestinal infection Claim 1; Page 100-101; 362pp; English.
This claimed Helicobacter pylori polypeptide, designated GHPO 408, can be used in vaccination methods for preventing or treating
                                  MCG4 protein; gene regulatory function; heat shock protein; guanine nucleotide exchange factor protein; MCG7 protein; heat shock-binding protein; MCG18 protein; zinc finger protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-NOV-1998 (first entry)

Melon aconitase encoded by cDNA clone 16.
Arabidopsis thaliana; aconitase; exon; intron; probe; melon; Zea mais;
Cucumis melo; maize; plant metabolism; Krebs cycle; glyoxylate cycle;
citrate; acetyl CoA; catabolism; polysaccharide; lipase; chimeric;
resistance marker; hormone; enzyme; ss.
    Aspergillus niger - used to transform hosts to confer reduced protease activity, for improved yields in protein expression claim 17; Page 70-72; 85pp; English.
The pepp gene was isolated from A.niger N400 and sequenced. The gene codes for a subtilisin-type protease PEPD. Engineered A.niger mutants Which are unable to produce functional PEPD can be used for increased recombinant production of heterologous proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R84345 standard; Protein; 764 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Particobacter pylori nucleic acid sequences and encoded probacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori propertion and for diagnosis of H. pylori infection

Claims 14,96; pages 957-958; 1145pp; English.

CC The protein may be used in a vaccine to prevent or treat H. pylori life culon or to identify H. pylori life cycle activators or inhibitors. The protein or a sample and the diagnosis of H. pylori infection of CC H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and sequences complementary to the DNA act as antisense sequences and sequences complementary to the DNA act as antisense sequence of CC acid sequences complementary to the DNA act as antisense sequence and distribution of H. pylori-specific antigens. The genomic sequence of the pylori (ATCC 55679) was determined from overlapping contigs generated for ORF of all least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR contine the particular polypeptide production, e.g. in E. coli

New plant acconitase, its fragments and related nucleic acid - also chimeric genes, transgenic plants, antibodies etc., used to modify plant acconitase, transgenic plants, antibodies etc., used to modify plant metabolism by regulating carboxylic acid prodn.

Example 4: Fig 4: 122pp; French.

The amino acid sequence of the melon aconitase encoded by the melon aconitase gene clone [6. The gene was isolated by screening a melon condition in the normal and aconitase and good homology in the N-terminal sequence was mitochondrial aconitase and good homology in the N-terminal sequence was conserved. A 2.2 kb EcoRI fragment of the melon aconitase cDNA was used as probe to isolate the sequence of the Arabidopsis thaliana aconitase constant a partial gene sequence of the maize aconitase gene (T02365). The Arabidopsis thaliana aconitase and contrase contase. This leads to overproduction of acids in the Krebs and of aconitase. This leads to overproduction of acids in the Krebs and Givenible the expression of aconitase, in the Krebs and Givenible the expression of aconitase, and alterations of metabolism contase gene or its promoter, are used to provide controlled expression e.g. during consistance markers, hormones, etc., in plants.

Submitted (13-OGT-1998) Laboratory of Genetics, University of Wisconsin, 445 Henry Mall, Madison, WI 53706, USA

This sequence was determined by the E. coli Genome Project at the University of Wisconsin-Madison (Frederick R. Blattner, director). Supported by Nill grants HG00301 and HG01428 (from the Human Genome Project and NCHGR). The entire sequence was independently determined from E. coli K-12 strain MG1655. Predicted open reading frames were determined using GeneWark software, kindly supplied by Mark Borodovsky, Georgia Institute of Technology, Atlanta, GA, 30332 [e-mail: mark@amber.gatech.edu]. Open reaging frames that have been correlated with genetic loci are being annotated with CG Site Nos., unique ID nos. for the genes in the E. coli Genetic Stock Center (CGSC) datebase at Yale University, kindly supplied'by wary Berlyn. A public version of the database is accessible (http://cgsc.biology.yale.edu). Annotation of the genome is an ongoing task whose goal is to make the genome sequence more useful by correlating it with other data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Riley; added promoters, protein binding sites, and repeated sequences described in reference 1. The unique numeric identifiers beginning with a lowercase 'b' assigned to each gene (protein- or RNA-encoding) are now designated as gene synonyms instead of labels. This should allow them to be searched for in Entrez as gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 (bases 1 to 10959)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NOTE: This record contains 113 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that

LOCUS AC008911 226805 bp DNA HTG 14-JAN-2000
DEFINITION Homo sapiens chromosome 5 clone CITB-H1_2268J5, WORKING DRAFT SEQUENCE, 95 unordered pieces. NOTE: This is a 'working draft' sequence. It currently consists of 95 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved. 28347 28248 ACCCAGCCGGGTAAACGCACCGGAAAATCTATTATGTGCAGGTGGAAGG 28297 167 rSerTrpLeuLysIleThrLeuTyrGluGlyArgAsnArgGlnValArgA 184 134 134 snAspGlyProThrLeuProAlaGlyIleGluArgValAsnGluProGlu 150 151 TrpLeuTrpProArgAsnProProlleArgGluArgLysSerlleProTh 167 contig of 1018 bp in length gap of unknown length contig of 1052 bp in length gap of unknown length contig of 1038 bp in length 117 yGluProAspAspAlaSerLeuAlaLysLeuArgAsnGlyValThrLeuA AC008911.2 GI:6693307 HTG; HTGS_PHASE1; HTGS_DRAFT 2070: 1018: 28498 GCATGACCGCCCAT 28511 184 rgMetThralaHis 188 seq_name: gb_htg6:AC008911 Homo sapiens 1019 human. The H. influenzes sequence has been updated by R. Fleischmann. New
database matches have been assigned, product names have been
improved, and a number of frame shifts have been corrected. We
gratefully acknowledge the work of Tatusov et. al. We have
incorporated their annotation into the /notes fields of the
                                                                                                                                                                                                                                         Rd section 67 of 163 of the complete genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (28-MAY-1998) The Institute for Genomic Research, 9712 Medical Center Dr. Rockville, MD 20850, USA
The whole genome was shifted by 588 nucleotides for a new start on Sep 30, 1996 this sequence version replaced g1:1221393.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9712
